G-Drill

The HE-VA G-Drill is a newly developed seeder for those who refuse to compromise on grassland maintenance and reseeding performance. It has been specifically designed for the establishment of new grass-land areas as well as overseeding in existing swards. At the same time, it is also suitable for sowing grain crops. At the heart of the system is the HE-VA Multi-Seeder, ensuring uniform and reliable seed metering.

YOUR BENEFITS AT A GLANCE

Heavy-Duty Disc Coulters

Serrated 400 mm disc coulters create a clean seed furrow – ideal in conditions with large amounts of crop residue and for accurate seed placement.

Precise Seeding Depth

The adjustable packer roller and rigid coulters mounting ensure a consistent and accurate seeding depth.

High Operational Flexibility

A versatile range of equipment options – including adjustment of coulters pressure – ensures optimum results under all conditions.

Disc Coulters with a 4° Working Angle

The G-Drill is equipped with robust 400 mm disc coulters positioned at an optimal 4° angle to the direction of travel. This creates a clean furrow up to 20 mm deep, allowing seeds to be placed accurately. The serrated outer edge of the discs ensures reliable rotation, even in dense vegetation and older grass swards. This guarantees effective soil penetration and excellent seed-to-soil contact for every seed.

Roller Types

The G-Drill is available with two different roller options:

Star Roller
Plain Roller

Multi-Seeder

- Hydraulic fan
- Hopper capacity of 410 or 660 litres
- Available with either mechanical control (via seed wheel) or electronic control (AC or ISOBUS)

Perfect Seeding Depth - Across All Terrain

To ensure a uniform seeding depth, the machine is guided by an adjustable packer roller. Depending on soil conditions, different roller types can be selected to achieve optimum results for every task. For particularly demanding conditions, an optional coulters pressure enhancement system is available. Using the tractor's linkage arms, pressure on the coulters can be increased to ensure precise seed placement, even on hard soil surfaces.
